

## Research

# The Inflation Reduction Act’s Medicare Budget Implications: Results for States and Regions

DOUGLAS HOLTZ-EAKIN, GORDON GRAY | JANUARY 10, 2024

### Executive Summary

- The Inflation Reduction Act contains two Medicare provisions – an “inflation tax” and drug price “negotiation” – that are estimated to save \$266 billion from 2023 to 2031.
- Previous American Action Forum [research](#) established that some Medicare beneficiaries may see lower drug prices based on certain provisions included in the law, but the Medicare program does not benefit from an additional \$266 billion in potential savings spent to subsidize clean energy.
- This research breaks out these impacts by states and regions in the United States.

### Introduction

The Inflation Reduction Act (IRA) has two primary policy initiatives: reforms to Medicare prescription drug policies and large-scale subsidies to clean (non-fossil) energy. In discussing the IRA, advocates typically keep the two separate, giving the impression that Medicare drug policy will yield savings for the Medicare program while clean energy subsidies will speed the transition to a new energy portfolio. But in fact, the two are linked by the unified federal budget. Previous American Action Forum [research](#) makes clear that some Medicare budget savings will be spent to subsidize clean energy.

Thus, some beneficiaries may benefit from lower drug prices and lower corresponding out-of-pocket costs. But the possibility of additional Medicare benefits such as lower premiums or broader options from the \$266 billion in budget savings used to subsidize clean energy will not be realized. The map and table below summarizes the geographic distribution of that lost opportunity across U.S. regions and states.
